

ABSTRACT OF THE DISCLOSURE

A wrench structure includes a wrench body having a handle portion.

The handle portion is formed with a reinforcement portion having a first side

formed with a first holding portion and a second side formed with a second

5 holding portion. The first holding portion has a plane vertical to that of the

second holding portion. Thus, the user's hand and the holding portion of the

wrench body have a larger contact area, so that the holding portion of the

wrench body can apply a larger force and torque to drive and rotate the

workpiece, such as the nut or the like.
